the 20th century, however, the situation reversed. The potential energy of world class pole vaulters now routinely exceeds the kinetic energy of world class sprinters. It would appear that vaulters have discovered a way to "violate" the law of conservation of energy.

Conservation of Energy - Problems - The Physics Hypertextbook

If a particle or body is acted upon only by conservative forces energy is conserved. This means that the total kinetic and potential energy in the system remains constant, and does not change. Such a system has no friction forces acting on it, and as such is an

The obvious advantage of energy conservation is that, we can slow down the depletion of the energy resources so that we have more of it left for future use. As mentioned above, efficient and wise use of energy can alleviate the problem of its crisis.

Conservation of Mechanical Energy problems relate speed of an object at different positions. In order to work a problem using Conservation of Energy, you need to know either that there are no significant forces taking energy out of the system or the size of those forces. Conservation of Energy will not tell you

Conservation of Energy - Practice - The Physics Hypertextbook

Conservation of energy applies only to isolated systems. A ball rolling across a rough floor will not obey the law of conservation of energy because it is not isolated from the floor. The floor is, in fact, doing work on the ball through

is when the rider starts off. So the rider starts off at the top of this hill. So definitely some potential energy. And is stationary, so there's no kinetic energy. So all of the energy is potential, and what is the potential energy? Well potential energy is equal to mass times the acceleration of gravity times height, right?
