With the aid of sedimentological as well as paleoecological data, the microfacies types of limestone of various ages can be combined into major types which reflect the depositional and ecological conditions in a certain sedimentary environment. This concept, which was developed on Upper Triassic reef carbonates in the Alpine Mediterranean region (E. Flügel, 1972), was expanded by Wilson (1975) and made more specific for numerous Paleozoic and Mesozoic examples.

The necessity for interdisciplinary studies is clearly expressed in this definition given by Amanz Gressly in 1838. In facies analysis paleontological, sedimentological, geological, and geochemical data provide the basic information about the sedimentary environment, the lithogenesis, and the biotopes of organisms preserved as fossils.

### Introduction to Facies Analysis | SpringerLink

Microfacies characteristics as seen in thin-sections include: the types of "groundmass", the different kinds of particle categories, depositional textures, and solution textures. All these criteria can lead to information about the sedimentological and diagenetic development of limestones.
